

Features and Notice

 2mm 1.2mm

- Weights / Stuffing for teddy bear making
- 18-8 stainless steel; rust resistant, nontoxic - safe
- 2mm(SR) and 1.2mm(SS) in size, polyhedral shape size = the distance across
- Heavy; 1kg per 200ml, 2.65 lbs. per cup (8 fl. oz.)

! **Keep out of reach of little children**

BearyShot SR (Stainless steel Regular) and **SS** (Stainless steel Subminiature) is stainless steel shot designed as weights and stuffing for teddy bear making.

Information may change without notice due to product improvement.

- // **BearyShot** is made of 18-8 stainless steel, which is rust resistant and nontoxic. You find the same material in your kitchen, a sink, knives and tableware. **BearyShot** can be **an alternative for toxic lead shot**.
- // You can use **BearyShot** for bears in various sizes. The material of the shot offers enough weight in small volume. Because of its tiny size, you can scarcely feel the rugged touch through your bear's fur.
 - For Miniature Bears ← Suitable for stuffing small or narrow space / Fine adjustment of weight
 - For Medium to Large Bears ← You can obtain enough weight with small volume / Suitable for a bear with a baby's weight. When you stuff a larger bear, you'd better use a fabric bag filled with the shot. This way, the shot will not scatter inside the bear.
- // **BearyShot** is in polyhedral shape with a rather smooth surface, not a ball. That is, the shot will settle stably while you're stuffing a bear with it. And since the surface is smooth, when you press a cluster of the shot inside the bear, the cluster will crush easily, giving soft feeling. Also, it will not go farther than balls in case you spill it on a floor.
- // The manufacturing processes of **BearyShot** do not include forming of a shiny fine ball. So, we can offer **BearyShot** at a lower price than stainless steel balls in the same size range.

■ Notice

- ⚠ **Keep out of reach of little children.** When the shots are internally taken or put in a nose, etc., consult a doctor.
- ⚠ In case **you get shots inside your eye, NEVER rub an eye.** Use clean flowing water to get rid of the shots. If they will not come out please consult a doctor.
- ⚠ Be careful that your pet **animal does not eat the shot.**
- ⚠ If you spill the shots on a floor **it will get slippery since shots roll.** Please collect spilt shots as soon as you can.
- ⚠ Stainless steel is hard and conductive. Be careful **not to drop shots into an appliance, PC/keyboard or any kind of machine.** In case you do, shut down the machine and get rid of the shots promptly.
- ⚠ **Storage:** ▶ Do not use containers made of fragile material such as glass or styrol. Such containers might break easily by shock under weight of the shot. (Recommended: A bottle or a thick bag made of polyethylene.) ▶ Contact with rusty steel may cause transfer of rust. ▶ Contact with metal other than stainless steel may cause rust when water exists between the two. ▶ Do not expose the shot to salt content (seawater, food, etc.) or sulfuric content (gas in volcanic region, etc.) for an excessive period of time. ▶ In general, you may safely store the shot in a plastic bag indoors.
- In the manufacturing processes, stainless steel dust sticks to the shots. Such impurities are removed as much as possible. Say, you stick your hand in a white cotton glove into a bowl of **BearyShot**. Then open and close the hand some tens of times inside the shot. After this, you can scarcely see stains on the glove. Note that if the shots are rubbed together for an excessive period of time or shots are crushed each other many times, some amount of dust will be produced. This is because the shot's surface has rough portions. We believe this is not harmful for bear making.
- You might find a very few shots that are not fully rounded. Since the amount is very small, they are not harmless in practical use.
- 18-8 stainless steel is usually not magnetic. But, due to the manufacturing process using impact, the shots are magnetic. To keep the price low no demagnetization was applied. Magnetism can be useful to gather shots when scattered.
- Size 1.2mm SS shots may get through a gap between a cotter pin and a disk hole at a joint. When you make a bear with a loose jointing, shots might spill through the gap. Please take this into consideration. Use an internal bag, for example.
- Sizes are in nominal values. Due to a non-spherical shape, the distance across may vary a bit.
- In case you need to dispose of the shot, please follow the local rules and handle it as metal waste.
